

Dear Sir/ Madam,

My name is Fabian Rood and I am a second year Applied Biology student at HAS University of Applied Sciences in the Netherlands. This is a bachelor's degree study which specializes in teaching to plan, carry out and report biological research. Currently I am looking for a suitable place for my internship abroad from February to June 2021.

During my research project on wildlife corridors last year I became interested in ecology. I intend on majoring in ecology so after this project would like to apply the knowledge and experience I gained to larger animals and ecosystems, preferably to my favorite animal species: wild cats. On the website of Cheetah Conservation Fund I have read about the current research projects like the Cheetah Census Research, habitat and genetic researches. These projects match up exactly with the skills I learned during my degree course so working at CCF would be the perfect opportunity to gain experience in ecology.

Through my degree course I worked in project teams doing research in which I gained experience in wildlife monitoring, behavioral research and coprological examination. Working in group projects makes communication and planning a requirement, besides that I have gained some experience in SPSS statistics, ArcMap GIS and Data-analyzing.

I have been working as an industrial cleaner for 2 years which has been valuable teaching me to work quick, efficient and accurate. Since 2016 I have been a professional DJ which taught me being creative, patient and disciplined. Also, as a DJ I gained some experience in entrepreneurship and I am strong in connecting with people.

I would be most grateful if you could consider me for a suitable project. I very much appreciate your consideration.

Yours sincerely,  
Fabian Rood
